

Fully welded styli clusters

For use on primarily rigid measuring
systems

Customised designs for rigid measuring systems

Expand your measuring system with our styli configurations primarily for rigid measuring systems such as Renishaw SP80 and ZEISS VAST MT. Easily measure features that are rotated or tilted relative to the base plane.

With a pre-configured carrier, multiple probes can be set at different spatial angles, minimising the need for expensive components such as probe change plates.

The configurations are highly suitable for series production as they are adapted to specific measurement tasks. The fully welded, monolithic configuration ensures that the angle cannot be changed unintentionally. itp takes responsibility for design, production and documentation, including measurement protocol.
