

Hexagon compatible styli

High quality styli for coordinate
measuring machines

Precision styli for Hexagon CMMs

itp extends its M3 product range with a selection of styli designed for maximum compatibility with Hexagon measuring systems.

High quality materials and manufacturing

The holder and stem are made from a single piece of stainless steel using a special manufacturing process. The holders are assembled with balls of different materials using itp's innovative joining technology, ensuring maximum concentricity of the ball to the stylus axis. This ensures the best possible calibration values and measurement results.

First class styli

Our styli are fitted with a full sphere made from the highest quality ruby, for example. This acts as the probing element, maximising accuracy and reliability.
